

FLOATING SINK KIT FSK-1B

Floating Sink Kit: FSK-1B

Hang a sink by one side wall and one bracket (L or T) up to 60" or less.

This kit consists of two wall cleats and either one "L" Bracket or one "T" Bracket. The Steel Wall Bracket must be secured to a wall stud prior to sheet rock and tile. The wall cleats can be installed after tile and/or painting.

Mount the wall bracket first: Please refer to the Bracket Mounting Instruction Sheet to mount the bracket.

Mounting the wall cleats: Cut the wall cleats down to the correct sizes. Always keep the side wall cleat 2" less than the total width of your concrete sink.

Example: Sink is 60" x 21" - Cut side wall cleat to a length of 19".

This will ensure there will be plenty of room between the inside of the front sink edge and the wall cleat. Make sure that the wall cleats are set flush and level to the bracket height. Always make sure that the wall cleats are screwed to the wall studs. If there is tile up on the walls, use plastic wall anchors to secure the cleats to the tile.
